Could a new technology increase EV battery range?

(Image credit: Artur Debat via Getty Images) A technology that could dramatically increase the range and decrease the charging time of electric vehicle (EV) batteries could soon be in many more cars. The technology swaps the graphite normally used on the negatively charged anodes of lithium-ion EV batteries for silicon.

What will be the future of battery technology?

Then there might be improved lithium-ion batteries, maybe using silicon anodes or rocksalt cathodes, for mid-range vehicles, or perhaps solid-state lithium batteries will take over that class. Then there might be LiS or even lithium-air cells for high-end cars -- or flying taxis. But there's a lot of work yet to be done.
